

POWERTEX UNIVERSAL MEDIUM

dry & cure time ?

for example

it goes without saying
that a clay ball of 10 cm diameter,
to dry to the core,
requires a much longer drying (hardening) time
than a clay ball of only 5 cm thick

think of your artwork as if it were
a thick winter coat which obviously has longer needed to dry,
than a thin summer jacket

and still different in the summer or in the winter period

whether it is in the sun or in a damp basement
